MEDI ASSIST

MUM03831566

Dear Sir / madam,

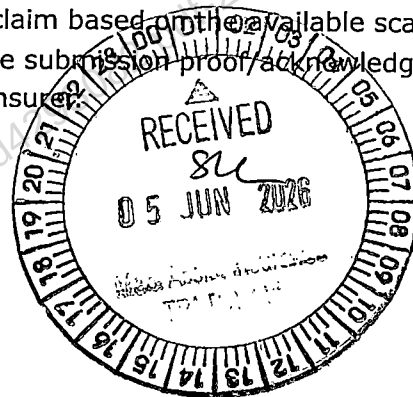

With reference to the query raised for Claim No. 50078939 regarding submission of supportive investigation reports and medical records (PET Scan, CT, Biopsy, etc.) in hard copy format.

Please note that the original hard copy documents have already been submitted by the customer to another insurer under the National Insurance Policy claim process. Currently, only scanned copies/documents shared through email are available with us, which have already been submitted for your reference.

We request you to kindly process the claim based on the available scanned copies. If required, we can also arrange submission proof/acknowledgement of documents submitted to the other insurer.

Kindly do the needful.

Thank You.

Dear Member,

Claim Number	50418323
Claimed Amount	107817
Employee ID	1
Employee Name	Bhargav P Sanghavi
Patient Name	Jyotsana P Sanghavi
Date of Admission	28 Apr 2026 08:00 AM
Date of Discharge	28 Apr 2026 12:00 PM
Medi Assist ID	5137574955
Policy Holder	Bhargav P Sanghavi
Insurer Claim No	132200/48/2027/00001011
Insurer Member ID	3

After reviewing the documents you submitted, we found that we still require the following information to establish the payability of your claim:

Document(s) Required	Status	First raised on
Kindly provide investigation report supporting the diagnosis: Biopsy Reports	Not Available	21-05-2026 16:56:55

Please provide the above-mentioned documents and information within 10 days of this letter so that we can continue processing your claim. Submission is mandatory; we will not be able to proceed with the review until these are received.

It shall be the sole responsibility of the insured to submit the required claim documents.

WHOLE BODY 18F-FDG PET-CT SCAN

CLINICAL DATA: A case of carcinoma ovary; post chemotherapy. This scan is done for current disease evaluation.

PROCEDURE: Whole-body PET-CT scan was performed after injection of 7.1 mCi of F-18 FDG on multidetector PET-CT scanner from vertex to mid-thigh. Serial multiplanar sections were obtained after intravenous contrast injection. A separate sequence with breath hold was performed for lung examination. A semi quantitative analysis of FDG uptake was performed by calculating SUV value corrected for dose administered and patient lean body mass. Blood glucose level at the time of injection was 107 mg%.

FINDINGS:

Physiological bio distribution of FDG is seen in brain, bilateral tonsils, liver, kidney, bowel and urinary bladder.

HEAD & NECK:

No focal abnormally increased FDG activity is seen in bilateral cerebral or cerebellar hemispheres.
(Note: If there is a strong suspicion for brain metastasis then MRI is suggested for further evaluation as smaller lesions may not be detected on FDG PET/CT).

Normal physiological uptake is seen in the nasopharynx, oropharynx, hypopharynx and larynx.
 No abnormal FDG uptake is seen in the thyroid gland.
 Non-FDG avid subcentimetric sized left supraclavicular lymph nodes are seen.

CHEST:

Chemoport noted in situ in right anterior chest wall.
 Non-FDG avid tiny nodules measuring up to 3 mm are seen in left lung upper lobe – status quo.
 Patchy areas of ground-glass opacities are seen in both lungs.
 There is no evidence of pleural effusion or thickening seen on either side.
 The trachea and main bronchi appear normal.
 The heart and mediastinal vascular structures are well opacified with intravenous contrast.
 There is no size significant or abnormal FDG avid hilar or mediastinal lymph nodes noted.
 No size significant or abnormal FDG avid supraclavicular or axillary lymph nodes noted.

Patient Name: Mrs. Jyotsana P Sanghavi	F / 64 Yrs
Ref by : Dr. Ashay P Karpe	Date: 19.02.2026

ABDOMEN & PELVIS:

Status post hysterectomy with no abnormal FDG avid lesion is seen in the vaginal vault. Multiple FDG avid omental deposits are noted in right para-colic gutter, supra and infra colic region, left mesocolic space, pelvis (largest-3.8 x 4.5 cm, maxSUV-20.75 in right paracolic gutter). Diffuse FDG avid omento-peritoneal thickening is noted (maxSUV-15.85).

Liver, spleen, pancreas, both adrenal glands and bilateral kidneys appear unremarkable. Gallbladder shows evidence of intraluminal radio-opaque calculus with no abnormal FDG uptake. Stomach, small and large bowel appear unremarkable. No size significant or abnormal FDG avid abdominal or pelvic lymph nodes noted. Moderate ascites is seen.

MUSCULOSKELETAL:

Low-grade FDG uptake is seen in periarticular region of both shoulder joints - likely inflammatory. Low-grade FDG uptake is in right sacro-iliac joint - likely inflammatory.

No focal abnormal FDG uptake is seen in visualized bones. Marrow uptake is within normal limits.

IMPRESSION:

Compared to previous PET-CT dated 06.03.2025, present PET-CT scan reveals,

- Significant interval increase in extent and metabolic activity of previously noted omento-peritoneal thickening and deposits.
- Interval increase in extent of ascites.
- No other metabolically active lesion is noted elsewhere on the present PET-CT scan.

Overall scan findings favor disease progression.

Ref. By : Dr. Karpe Ashay MD DM

Registered On : 13-Feb-2026 04:55 PM
Collected On : 13-Feb-2026 05:02 PM
Reported On : 13-Feb-2026 06:25 PM
Sample Type :

RENAL PROFILE

Test	Result	Unit	Reference Range
Creatinine, Serum <i>Urea Nitrogen Jaffe Reaction</i>	0.6	mg/dL	Upto 1.2
eGFR (Mdrd)	106.6	ml/min/1.73 Sqm	

(eGFR-MDRD Interpretation):

More than 90 ml/min/1.73 Sqm -- Normal eGFR

60-89 ml/min/1.73 Sqm -- Mild decrease in eGFR is common in 30% healthy adults. Suggest repeat testing in 6 to 12 months.

Exclude kidney disease in those at high risk (Diabetes & Hypertension)

30-59 ml/min/1.73 Sqm -- Consistent with moderate chronic kidney disease if confirmed over three months. Consider nephrology referral if progressive deterioration of more than 20% for eGFR or Creatinine.

15-29 ml/min/1.73 Sqm -- Consistent with severe chronic kidney disease. Consider nephrology Referral

Less than 15 ml/min/1.73 Sqm -- Consistent with kidney failure. Consider urgent nephrology referral

Additional information

1. eGFR is frequently used for DRUG DOSING using Cockcroft-Gault equation. eGFR-MDRD has not been validated for the purpose.
2. eGFR-MDRD assumes "steady state". For rapidly changing kidney function, monitor serum creatinine.
3. Creatinine and thus eGFR varies with muscle mass; the MDRD calculation a correction of "X 1.21" for "African Americans"
4. MDRD is normalized for average height and weight. Consult a nephrologist if a patient has unusual physical considerations.
5. Note that eGFR is less precise in its estimation when > 60 ml/min/1.73 Sqm
6. Separate formula i.e. eGFR-Schwartz is to be used for patients younger than 18 years of age.

Sample Type :

CANCER ANTIGEN - 125

Test	Result	Unit	Reference Range
CA 125, Serum (Median, U/L)	: 261.00	U/mL	0 - 35

Description of the test :-

- CA- 125 is a glycoprotein found on the surface of many ovarian cancer cells & in some normal tissues.
- The test is used primarily for diagnosis of malignancies of the ovary & to distinguish benign from malignant tumors.
- CA- 125 may be elevated in malignancies of ovaries, fallopian tubes & the endometrium.
- It may also be elevated in malignancies of pancreas, liver, lungs, & non-Hodgkins lymphomas.
- Benign conditions with elevated CA- 125 include pregnancy, endometriosis, menstruation, pelvic inflammatory disease, cirrhosis & renal failure.

Heterophilic antibodies in human serum can react with reagent immunoglobins, interfering with in vitro immunoassays. Patients routinely exposed to animal serum products can be prone to this interference and anomalous results may be observed.
